\*1. These alarms can be reset, but a Canceled Program Table Error (E44E) will occur the next time you attempt to start program table operation, so program table operation will not be possible.

\*2. These alarms can be reset, but it is possible that the ZONE signals (POUT0 to POUT7) will be output incorrectly. When using the ZONE table, correct the ZONE table without resetting.

\*3. These alarms can be reset, but a Canceled JOG Speed Table Error (E46E) will occur the next time you attempt to start JOG speed table operation, so JOG speed table operation will not be possible.

### 15.2.4 Resetting INDEXER Alarms

If there is an ALM (Servo Alarm) signal, use one of the following methods to reset the alarm after eliminating the cause of the alarm.

Be sure to eliminate the cause of an alarm before you reset the alarm. If you reset the alarm and continue operation without eliminating the cause of the alarm, it may result in damage to the equipment or fire.

#### Resetting Alarms with the SigmaWin+

Use the following procedure to reset alarms with the SigmaWin+.

- 1. Click the <u>I</u> Servo Drive Button in the workspace of the Main Window of the SigmaWin+.
- 2. Select Display Alarm in the Menu Dialog Box. The Alarm Display Dialog Box will be displayed.

3. Click the Reset axes Button.

The alarm will be reset, and the alarm display will be cleared.

This concludes the procedure to reset alarms.

## Resetting Using /ALM-RST (Alarm Reset) Signal

| Туре      | Signal Name                                                          | Connector Pin No. | Description |  |  |
|-----------|----------------------------------------------------------------------|-------------------|-------------|--|--|
| Input     | /ALM-RST                                                             | CN1-7             | Alarm reset |  |  |
| Valuation | Vary appropriate and the patting for the VALNA DOT signal with DrDCO |                   |             |  |  |

You can change the setting for the /ALM-RST signal with PnB52.

|       | Parameter              | Meaning                                                                 | When Enabled  |  |
|-------|------------------------|-------------------------------------------------------------------------|---------------|--|
|       | 0<br>(default setting) | Resets alarms by switching input signal from OFF (open) to ON (closed). |               |  |
| PnB52 | 1                      | Resets alarms by switching input signal from ON (closed) to OFF (open). | After restart |  |
|       | 2                      | Does not reset alarms. (Signal is ignored.)                             |               |  |
|       | 3                      | Dues not reset alarms. (Signal is ignored.)                             |               |  |

### **Resetting Alarms Using the Digital Operator**

Press the **ALARM RESET** Key on the Digital Operator. Refer to the following manual for details on resetting alarms.

Ω Σ-7-Series Digital Operator Operating Manual (Manual No.: SIEP S800001 33)

Information The alarm of the INDEXER module cannot be reset using the **ALARM RESET** Button on the digital operator. To reset the alarm of the INDEXER module, perform INDEXER alarm reset (FnB0C). For details, refer to the following section.

15.2.5 Displaying the INDEXER Alarm History

## 15.2.5 Displaying the INDEXER Alarm History

The alarm history displays up to the last ten alarms that have occurred in the SERVOPACK and INDEXER module.

#### Preparations

No preparations are required.

### **Applicable Tools**

The following table lists the tools that you can use to display the alarm history.

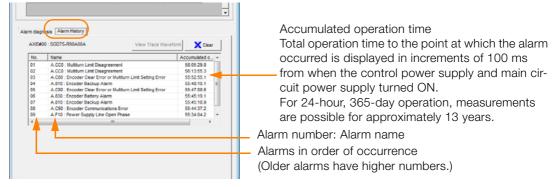

| Tool             | Fn No./Function Name            | Reference                                                                     |
|------------------|---------------------------------|-------------------------------------------------------------------------------|
| Digital Operator | FnB0D                           | Ω-7-Series Digital Operator Operating Manual<br>(Manual No.: SIEP S800001 33) |
| SigmaWin+        | Troubleshooting – Display Alarm | Operating Procedure on page 15-48                                             |

### **Operating Procedure**

Use the following procedure to display the alarm history.

- 1. Click the <u>Servo</u> Drive Button in the workspace of the Main Window of the SigmaWin+.
- 2. Select Display Alarm in the Menu Dialog Box. The Alarm Display Dialog Box will be displayed.
- 3. Click the Alarm History Tab.

The following display will appear and you can check the alarms that occurred in the past.

- **Information** 1. If the same alarm occurs consecutively within one hour, it is not saved in the alarm history. If it occurs after an hour or more, it is saved.
  - 2. You can clear the alarm history by clicking the **Clear** Button. The alarm history is not cleared when alarms are reset or when the SERVOPACK main circuit power is turned OFF.

This concludes the procedure to display the alarm history.

## 15.2.6 Clearing the INDEXER Alarm History

You can clear the alarm history that is recorded in the SERVOPACK and INDEXER module. The alarm history is not cleared when alarms are reset or when the SERVOPACK main circuit power is turned OFF. You must perform the following procedure.

### Preparations

Always check the following before you clear the alarm history.

• The parameters must not be write prohibited.

### **Applicable Tools**

The following table lists the tools that you can use to clear the alarm history.

| Tool             | Fn No./Function Name            | Reference                                                                       |
|------------------|---------------------------------|---------------------------------------------------------------------------------|
| Digital Operator | FnB0C                           | C Σ-7-Series Digital Operator Operating Manual<br>(Manual No.: SIEP S800001 33) |
| SigmaWin+        | Troubleshooting – Display Alarm | B Operating Procedure on page 15-49                                             |

### **Operating Procedure**

Use the following procedure to reset the alarm history.

- 1. Click the *P* Servo Drive Button in the workspace of the Main Window of the SigmaWin+.
- 2. Select Display Alarm in the Menu Dialog Box. The Alarm Display Dialog Box will be displayed.
- 3. Click the Alarm History Tab.
- 4. Click the Clear Button.

The alarm history will be cleared.

| No. | Name                                                                                                 | Accumulated o. | T,  |

| •   |                                                                                                      | •              |     |
|     |                                                                                                      |                |     |

This concludes the procedure to reset the alarm history.

15.2.7 Resetting Alarms Detected in Option Modules

### 15.2.7 Resetting Alarms Detected in Option Modules

If any Option Modules are attached to the SERVOPACK, the SERVOPACK detects the presence and models of the connected Option Modules. If it finds any errors, it outputs alarms.

You can delete those alarms with this operation.

- **Information** This operation is the only way to reset alarms for Option Modules. The alarms are not reset when you reset other alarms or when you turn OFF the power supply to the SERVOPACK.
  - Always remove the cause of an alarm before you reset the alarm.

### Preparations

Always check the following before you clear an alarm detected in an Option Module. • The parameters must not be write prohibited.

### **Applicable Tools**

The following table lists the tools that you can use to reset Option Module configuration errors.

| Tool             | Fn No./Function Name            | Reference                                                                     |
|------------------|---------------------------------|-------------------------------------------------------------------------------|
| Digital Operator | Fn014                           | Σ-7-Series Digital Operator Operating Manual<br>(Manual No.: SIEP S800001 33) |
| SigmaWin+        | Troubleshooting – Display Alarm | Coperating Procedure on page 15-50                                            |

### **Operating Procedure**

Use the following procedure to reset alarms detected in Option Modules.

- 1. Click the *P* Servo Drive Button in the workspace of the Main Window of the SigmaWin+.
- **2.** Select Display Alarm in the Menu Dialog Box. The Display Alarm Dialog Box will be displayed.
- 3. Click the Reset axes Button.

|            | Execute                                                                                                                                                   |

5. Read the precaution and then click the OK Button.

6. Read the precaution and then click the OK Button.

7. Turn the power supply to the SERVOPACK OFF and ON again.

This concludes the procedure to reset alarms detected in Option Modules.

15.2.8 Resetting Motor Type Alarms

### 15.2.8 Resetting Motor Type Alarms

The SERVOPACK automatically determines the type of Servomotor that is connected to it. If the type of Servomotor that is connected is changed, an A.070 alarm (Motor Type Change Detected) will occur the next time the SERVOPACK is started. If an A.070 alarm occurs, you must set the parameters to match the new type of Servomotor.

An A.070 alarm is reset by executing the Reset Motor Type Alarm utility function.

- Information 1. This utility function is the only way to reset an A.070 alarm (Motor Type Change Detected). The errors are not reset when you reset alarms or turn OFF the power supply to the SER-VOPACK.
  - 2. If an A.070 alarm occurs, first set the parameters according to the newly connected Servomotor type and then execute the Reset Motor Type Alarm utility function.

### Preparations

Always check the following before you reset a motor type alarm.

• The parameters must not be write prohibited.

### **Applicable Tools**

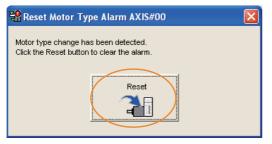

The following table lists the tools that you can use to clear the motor type alarm.

| Tool             | Fn No./Function Name                        | Reference                                                                       |
|------------------|---------------------------------------------|---------------------------------------------------------------------------------|
| Digital Operator | Fn021                                       | C Σ-7-Series Digital Operator Operating Manual<br>(Manual No.: SIEP S800001 33) |
| SigmaWin+        | Troubleshooting – Reset Motor<br>Type Alarm | Operating Procedure on page 15-52                                               |

### **Operating Procedure**

Use the following procedure to reset Motor Type alarm.

- 1. Click the <u>I</u> Servo Drive Button in the workspace of the Main Window of the SigmaWin+.
- 2. Select Reset Motor Type Alarm in the Menu Dialog Box. The Reset Motor Type Alarm Dialog Box will be displayed.
- 3. Click the Reset Button.

4. Read the precaution and then click the OK Button.

5. Read the precaution and then click the OK Button.

**6.** Turn the power supply to the SERVOPACK OFF and ON again.

This concludes the procedure to reset Motor Type alarms.

15.3.1 List of Warnings

# 15.3 Warning Displays

Warnings are displayed to warn you before an alarm occurs. If a warning occurs in the SERVO-PACK, the status is displayed as described below.

#### Status Display

#### 3 15.3.3 INDEXER Module Error Displays and Troubleshooting

Note: 1. A warning code is not output unless you set Pn001 to n.1 [] (Output both alarm codes and warning codes).

2. Use Pn008 = n.□X□□ (Warning Detection Selection) to control warning detection. However, the following warnings are not affected by the setting of Pn008 = n.□X□□ and other parameter settings are required in addition to Pn008 = n.□X□□.

| Warning | Parameters That Must Be Set to Select Warning Detection                                                                                              | Reference |

## 15.3.2 Troubleshooting Warnings

The causes of and corrections for the warnings are given in the following table. Contact your Yaskawa representative if you cannot solve a problem with the correction given in the table.

| Warning Number:<br>Warning Name                               | Possible Cause                                                                                                                                             | Confirmation                                                                                                                   | Correction                                                                                                                                                                                                                                                                                                                                | Reference |

15.3.3 INDEXER Module Error Displays and Troubleshooting

## 15.3.3 INDEXER Module Error Displays and Troubleshooting

Negative responses (error responses) to input signals, serial commands, or operations from the Digital Operator are known as errors.

The servo will not be turned OFF when an error occurs.

#### Status Displays

| SERVOPACK Panel Display                                 | "A.A9F" is displayed for 2 seconds.                                                                                            |  |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|--|
| Indicator                                               | Red indicator: Flashes for 2 seconds.<br>Refer to the following section for details.<br><i>I</i> 1.5.2 Indicators on page 1-11 |  |
| Digital Operator                                        | "A.A9F" is displayed for 2 seconds at the top left of the screen.                                                              |  |
| Response to the Alarm or Warning Read<br>Command (ALM)  | No change                                                                                                                      |  |
| Response to the Most Recent Error Read<br>Command (ERR) | Error code (the most recent (closest) error code)                                                                              |  |
| ALM Signal                                              | No change                                                                                                                      |  |
| /WARN Signal                                            | The signal is valid for 2 seconds.                                                                                             |  |

The INDEXER Module error displays and the corrective actions are shown below.

## **15.4** Troubleshooting Based on the Operation and Conditions of the Servomotor

This section provides troubleshooting based on the operation and conditions of the Servomotor, including causes and corrections.

| Problem                         | Possible Cause                                                                                                          | Confirmation                                                                                                                        | Correction                                                                                                                                              | Reference              |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
|                                 | The control power supply is not turned ON.                                                                              | Measure the voltage<br>between control power<br>supply terminals.                                                                   | Turn OFF the power<br>supply to the servo<br>system.<br>Correct the wiring so<br>that the control power<br>supply is turned ON.                         | -                      |
|                                 | The main circuit power supply is not turned ON.                                                                         | Measure the voltage<br>across the main circuit<br>power input terminals.                                                            | Turn OFF the power<br>supply to the servo<br>system.<br>Correct the wiring so<br>that the main circuit<br>power supply is turned<br>ON.                 | _                      |
|                                 | The I/O signal connector<br>(CN1) pins are not wired cor-<br>rectly or are disconnected.                                | Turn OFF the power sup-<br>ply to the servo system.<br>Check the wiring condi-<br>tion of the I/O signal con-<br>nector (CN1) pins. | Correct the wiring of<br>the I/O signal connec-<br>tor (CN1) pins.                                                                                      | page 4-36,<br>page 9-5 |
|                                 | The wiring for the Servomo-<br>tor Main Circuit Cables or<br>Encoder Cable is discon-<br>nected.                        | Check the wiring condi-<br>tions.                                                                                                   | Turn OFF the power<br>supply to the servo<br>system.<br>Wire the cable cor-<br>rectly.                                                                  | -                      |
| Servomotor<br>Does Not<br>Start | There is an overload on the Servomotor.                                                                                 | Operate the Servomotor<br>with no load and check<br>the load status.                                                                | Turn OFF the power<br>supply to the servo<br>system.<br>Reduce the load or<br>replace the Servomo-<br>tor with a Servomotor<br>with a larger capacity.  | -                      |
|                                 | The type of encoder that is being used does not agree with the setting of $Pn002 = n.\Box X \Box \Box$ (Encoder Usage). | Check the type of the encoder that is being used and the setting of Pn002 = $n.\Box X \Box \Box$ .                                  | Set Pn002 = $n.\Box X \Box \Box$<br>according to the type of<br>the encoder that is<br>being used.                                                      | page 6-23              |
|                                 | Settings for input signals<br>PnB03 to PnB12 are incor-<br>rect.                                                        | Check settings of input signals PnB03 to PnB12.                                                                                     | Correct the settings of input signals PnB03 to PnB12.                                                                                                   | page 6-3,<br>page 9-5  |
|                                 | The /S-ON (Servo ON) signal was not received.                                                                           | Check the commands sent from the host con-<br>troller.                                                                              | Turn ON the /S-ON sig-<br>nal from the host con-<br>troller.                                                                                            | page 9-5               |
|                                 | The P-OT (Forward Drive<br>Prohibit) or N-OT (Reverse<br>Drive Prohibit) signal is still<br>OFF.                        | Check the P-OT and N-<br>OT signals.                                                                                                | Turn ON the P-OT and N-OT signals.                                                                                                                      | page 9-5               |
|                                 | The current position of the servomotor is outside the software limit setting range.                                     | Check the error at the INDEXER Module.                                                                                              | Check the motor posi-<br>tion and software limit<br>setting (PnB21,<br>PnB23), then move the<br>servomotor into the<br>software limit setting<br>range. | -                      |
|                                 | There is no position refer-<br>ence, or it is incorrect.                                                                | Check the error at the INDEXER Module.                                                                                              | Set the program table correctly.                                                                                                                        | -                      |

|                                    |                                                                                                                    |                                                                                                                                                                                                                          | Continued from pre                                                                                                                                                                                     | vious page. |

|                                             | The encoder was subjected to excessive vibration or shock.                        | Turn OFF the power sup-<br>ply to the servo system.<br>Check to see if vibration<br>from the machine<br>occurred.<br>Check the Servomotor<br>installation (mounting sur-<br>face precision, securing<br>state, and alignment).<br>Check the linear encoder<br>installation (mounting sur-<br>face precision and secur-<br>ing method). | Reduce machine vibra-<br>tion. Improve the<br>mounting state of the<br>Servomotor or linear<br>encoder.                                                                                         | _         |  |  |
|                                             | The coupling between the machine and Servomotor is not suitable.                  | Turn OFF the power sup-<br>ply to the servo system.<br>Check to see if position<br>offset occurs at the cou-<br>pling between machine<br>and Servomotor.                                                                                                                                                                               | Correctly secure the coupling between the machine and Servomotor.                                                                                                                               | _         |  |  |
| Position<br>Deviation<br>(without<br>Alarm) | Noise interference occurred because of incorrect I/O signal cable specifications. | Turn OFF the power sup-<br>ply to the servo system.<br>Check the I/O signal<br>cables to see if they sat-<br>isfy specifications. Use a<br>shielded twisted-pair wire<br>cable or a screened<br>twisted-pair cable with<br>conductors of at least<br>0.12 mm <sup>2</sup> .                                                            | to the servo system.<br>eck the I/O signal<br>bles to see if they sat-<br>specifications. Use a<br>elded twisted-pair wire<br>ble or a screened<br>sted-pair cable with<br>nductors of at least |           |  |  |
|                                             | Noise interference occurred because an I/O signal cable is too long.              | Turn OFF the power sup-<br>ply to the servo system.<br>Check the lengths of the<br>I/O signal cables.                                                                                                                                                                                                                                  | The I/O signal cables<br>must be no longer than<br>3 m.                                                                                                                                         | -         |  |  |
|                                             | An encoder fault occurred.<br>(The pulse count does not<br>change.)               | _                                                                                                                                                                                                                                                                                                                                      | Turn OFF the power<br>supply to the servo<br>system.<br>Replace the Servomo-<br>tor or linear encoder.                                                                                          | _         |  |  |
|                                             | A failure occurred in the SER-<br>VOPACK.                                         | _                                                                                                                                                                                                                                                                                                                                      | Turn OFF the power<br>supply to the servo<br>system.<br>Replace the SERVO-<br>PACK.                                                                                                             | _         |  |  |
|                                             | The surrounding air tempera-<br>ture is too high.                                 | Measure the surrounding air temperature around the Servomotor.                                                                                                                                                                                                                                                                         | Reduce the surround-<br>ing air temperature to<br>40°C or less.                                                                                                                                 | -         |  |  |
|                                             | The surface of the Servomo-<br>tor is dirty.                                      | Turn OFF the power sup-<br>ply to the servo system.<br>Visually check the surface<br>for dirt.                                                                                                                                                                                                                                         | Clean dirt, dust, and oil from the surface.                                                                                                                                                     | _         |  |  |
| Servomotor<br>Overheated                    | There is an overload on the Servomotor.                                           | Check the load status with a monitor.                                                                                                                                                                                                                                                                                                  | If the Servomotor is<br>overloaded, reduce the<br>load or replace the<br>Servo Drive with a<br>SERVOPACK and Ser-<br>vomotor with larger<br>capacities.                                         | -         |  |  |
|                                             | Polarity detection was not performed correctly.                                   | Check to see if electrical angle 2 (electrical angle from polarity origin) at any position is between ±10°.                                                                                                                                                                                                                            | Correct the settings for<br>the polarity detection-<br>related parameters.                                                                                                                      | -         |  |  |

# **Parameter Lists**

This chapter provides information on the parameters.

lists 16

## 16.1 Parameter Configurations

| Туре                                    | Parameter No.                                                                                   | Parameter No.                                                                                                    |
|-----------------------------------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Function Selection<br>Parameters        | Pn000 to Pn081<br>PnB1F                                                                         | Select basic and application functions such as the type of control mode or the stop method when an alarm occurs. |
| Servo Gain and Other<br>Parameters      | Pn100 to Pn170                                                                                  | Set numerical values such as speed and position loop gains.                                                      |
| Position Control<br>Parameters          | Pn205 to Pn217                                                                                  | Set position control parameters such as average move-<br>ment time.                                              |
| Speed Control<br>Parameters             | Pn304 to Pn324                                                                                  | Set speed control parameters such as the speed feedback filter.                                                  |
| Torque Control<br>Parameters            | Pn401 to Pn460                                                                                  | Set torque control parameters such as the torque limit values.                                                   |
| Sequence Parameters                     | Pn502 to Pn561<br>PnB03 to PnB1E<br>PnB4F<br>PnB51 to PnB52                                     | Set conditions for the sequence I/O signals.                                                                     |
| Positioning<br>Parameters               | PnB20 to PnB2F<br>PnB50                                                                         | Set parameters related to positioning.                                                                           |
| Homing Parameters                       | PnB31 to PnB39                                                                                  | Set parameters related to homing.                                                                                |
| Others                                  | Pn600 to Pn604                                                                                  | Set other parameters.                                                                                            |
| Serial Communica-<br>tions Parameters   | PnB00 to PnB02                                                                                  | Set parameters related to serial communications (CN12).                                                          |
| Setup Information<br>Parameters         | PnB3B to PnB4D                                                                                  | Do not change these parameters.<br>These are reserved parameters.                                                |
| Fully-closed Loop<br>Control Parameters | Pn20A, Pn22A, Pn281<br>Pn51B, Pn52A                                                             | Set parameters related to fully-closed loop control.                                                             |
| Linear Servomotor<br>Parameters         | Pn080<br>Pn181 to Pn182<br>Pn281 to Pn282<br>Pn383 to Pn385<br>Pn480 to Pn49F<br>Pn581 to Pn587 | Set parameters related to linear servomotors.                                                                    |

Parameters are comprised of the types shown in the following table.

16.2.1 Interpreting the Parameter Lists

Indicates when a change to the

parameter will be effective.

## 16.2 List of Parameters

### 16.2.1 Interpreting the Parameter Lists

The types of Servomotors to which the parameter applies.

- All: The parameter is used for both Rotary Servomotors and Linear Servomotors.
- Rotary: The parameter is used for only Rotary Servomotors.
- Linear: The parameter is used for only Linear Servomotors.

Rotary Servomotor terms are used for parameters that are applicable to all Servomotors. If you are using a Linear Servomotor, you need to interpret the terms accordingly. Refer to the following section for details.

|                  |      |                                                                                                                                                                                                              |                                                           |                                                                                                                        |                 |                                                          | >                      | 1/              |                     |                |  |      |

#### List of Parameters 16.2.2

The following table lists the parameters.

Note: Do not change the following parameters from their default settings.

- Reserved parameters
- Parameters not given in this manual
  Parameters that are not valid for the Servomotor that you are using, as given in the parameter table
  - The following parameters will be set automatically when the INDEXER Module is mounted. Do not change the settings of these parameters.
- Ø Pn002 = n. DDDX, Pn205, Pn207 = n.XDDD, Pn50A to Pn512, Pn517, and Pn522 • Parameters that are unique to the INDEXER Module will be set automatically the first time the Note power supply is turned on after the INDEXER Module is mounted. Up to 10 s may be required for the SERVOPACK to start.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | vitchi         \*1. The following parameters are automatically set when the INDEXER Module is mounted to the SERVOPACK. Do not change the setting.

• Pn002 = n.□□□0

• Pn207 = n.1

• Pn50A = 8881h

• Pn50B = 8888h

• Pn510 = 0000h

\*2. This parameter is automatically set to 0 if a single-turn absolute encoder is used and Pn002 is set to n.  $\Box 0 \Box \Box$ .

\*3. Set a percentage of the motor rated torque.

\*4. When the INDEXER Module is mounted to the SERVOPACK, Pn50E is set to 0000h or 3000h according to the setting of PnB51. Do not change the setting.

\*5. When the INDEXER Module is mounted to the SERVOPACK, Pn50F is set to 0000h or 1200h according to the setting of PnB51. Do not change the setting.

\*6. When the INDEXER Module is mounted to the SERVOPACK, this parameter is automatically set according to the settings of PnB11 and PnB12. (Pn511 = n.8□■8, where □ = 4, 8, or D and ■ = 6, 8, or F) Do not change the setting.

16

- \*7. When the INDEXER Module is mounted to the SERVOPACK, this parameter is automatically set according to the settings of PnB1C, PnB1D, PnB1E, and PnB51. (Pn512 = n.0□□□, where □ = 0 or 1) Do not change the setting.
- \*8. When the INDEXER Module is mounted to the SERVOPACK, Pn517 is set to 0000h or 0321h according to the setting of PnB51. Do not change the setting.
- \*9. When the INDEXER Module is mounted to the SERVOPACK, this parameter is automatically set to between 0 and 99,999 according to the setting of PnB2D. Do not change the setting.

\*10.Normally set this parameter to 0. If you use an External Regenerative Resistor, set the capacity (W) of the External Regenerative Resistor.

- \*11. The upper limit is the maximum output capacity (W) of the SERVOPACK.
- \*12. These parameters are for SERVOPACKs with the Dynamic Brake Hardware Option. Refer to the following manual for details.

#### Ω Σ-7-Series AC Servo Drive Σ-7S/Σ-7W SERVOPACK with Dynamic Brake Hardware Option Specifications Product Manual (Manual No.: SIEP S800001 73)

\*13. The SGLFW2 is the only Yaskawa Linear Servomotor that supports this function.

- \*14. Enabled only when Pn61A is set to  $n.\square\square\square2$  or  $n.\square\square\square3$ .
- \*15.If you set PnB54 to 1 (Enable Expansion Mode), the following setting ranges will change.

| Parameter No. | Name                                                                                                                                                       | Setting Range                       |

\*1. This parameter is automatically set when the INDEXER Module is mounted to the SERVOPACK. Do not change the setting. Refer to the following sections for details.

16.2 List of Parameters on page 16-3

\*2. The enable timing depends on the digit that is changed. Refer to the following section for details.

16

# Appendices

The appendix provides information on compatibility between SERVOPACK functions and SigmaWin+ functions, Digital Operator procedures, an alphabetized list of serial commands, and a table of corresponding parameter numbers. (17)

\*1. You can use Un010 to monitor the upper limit setting for the maximum motor speed or the upper limit setting for the encoder output resolution.

You can monitor the upper limit of the encoder output resolution setting (Pn281) for the current maximum motor speed setting (Pn385), or you can monitor the upper limit of the maximum motor speed setting for the current encoder output resolution setting.

Select which signal to monitor with Pn080 = n.XDDD (Calculation Method for Maximum Speed or Divided Output Pulses).

If Pn080 = n.0□□□, the encoder output resolution (Pn281) that can be set is displayed.
If Pn080 = n.1□□□, the maximum motor speed (Pn385) that can be set is displayed in mm/s.

\*2. This applies to the following motors. The display will show 0 for all other models. SGM7M, SGM7J, SGM7A, SGM7P, SGM7G, SGMMV, SGM7E, SGM7F, and SGMCV

17.2.1 Overview

# **17.2 Operation of Digital Operator**

# 17.2.1 Overview

## **Functions List**

The table below shows whether functions of the digital operator can or cannot be used when an INDEXER Module is installed.

This chapter describes the operating procedures for the functions indicated with the thick-bordered frame in the table below. Refer to the following manual for information on functions that are not marked with bold lines.

Ω Σ-7-Series Servo Drive Digital Operator Operating Manual (Manual No.: SIEP S800001 33)

✓: Supported

-: Not supported

\*1. Refer to the following section for details.

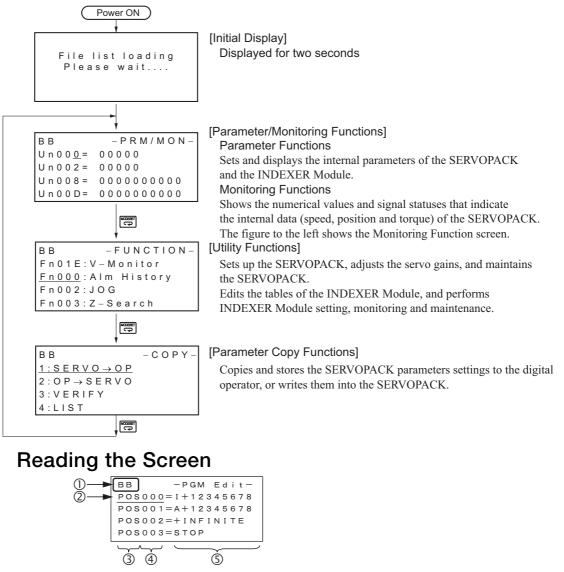

17.2.2 Operation of Utility Functions on page 17-10

\*2. To copy the INDEXER Module parameters (PnB00 to PnB52), use the SigmaWin+ parameter editing function.

17.2.1 Overview

## **Changing the Function**

Connect the digital operator to the SERVOPACK, and turn ON the power to the SERVOPACK. The initial display appears, and then the Parameter/Monitoring Function screen appears. Press the 😇 key to change the function.

• The SERVOPACK status is always displayed at the top left of the screen (①).

BB: Base blocked

RUN: Servomotor is ON

A.  $\Box\Box\Box$  : Alarm/warning is in effect ( $\Box\Box\Box$  is the alarm/warning code).

PT NT: Forward run and reverse run prohibited (Over travel)

- P-OT: Forward run prohibited (Over travel)
- N-OT: Reverse run prohibited (Over travel)
- P-LS: Forward software limit
- N-LS: Reverse software limit
- NO-OP: Setting disabled or setting error
- HBB: During hard wire base block
- The figure of editing screen used in the program tables, ZONE tables and JOG speed tables has the following elements.
  - ②: The article and table number currently selected
  - ③: The article of the table
  - ④: The table number
  - (5): The table settings

Note: The line beneath POS000 shows that this indication is flashing. This line does not appear on the actual screen. Note also that the part that flashes is referred to as the cursor in this document.

# 17.2.2 Operation of Utility Functions

## **Utility Functions**

The following table shows whether utility functions can be set or not with the digital operator.

| Fn No. | Function                                                                                      | Possi-<br>ble/Not<br>Possible | Remarks and Reference                                                 |
|--------|-----------------------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------------|
| Fn000  | Alarm history display                                                                         | ×                             | This utility function cannot be used.<br>Execute FnB0D instead.       |
| Fn002  | JOG operation                                                                                 | 0                             | Σ-7-Series Servo Drive                                                |
| Fn003  | Origin search                                                                                 | 0                             | Digital Operator<br>Operating Manual<br>(Manual No.: SIEP S800001 33) |
| Fn004  | Program JOG operation                                                                         | 0                             |                                                                       |
| Fn005  | Initializing parameter settings                                                               | ×                             | This utility function cannot be used.<br>Execute FnB0B instead.       |
| Fn006  | Clearing alarm history                                                                        | ×                             | This utility function cannot be used.<br>Execute FnB0C instead.       |
| Fn008  | Absolute encoder multiturn reset and encoder alarm reset                                      | 0                             |                                                                       |
| Fn00C  | Offset adjustment of analog monitor output                                                    | 0                             |                                                                       |
| Fn00D  | Gain adjustment of analog monitor output                                                      | 0                             |                                                                       |
| Fn00E  | Automatic offset-signal adjustment of motor current detection signal                          | 0                             |                                                                       |
| Fn00F  | Manual offset-signal adjustment of motor current detection signal                             | 0                             |                                                                       |
| Fn010  | Write prohibited setting                                                                      | 0                             |                                                                       |
| Fn011  | Servomotor model display                                                                      | 0                             |                                                                       |
| Fn012  | SERVOPACK software version display                                                            | 0                             |                                                                       |
| Fn013  | Multiturn limit value setting change when a multiturn limit disagreement alarm (A.CC0) occurs | 0                             |                                                                       |
| Fn014  | Resetting configuration error in option module                                                | 0                             | $\Sigma$ -7-Series Servo Drive                                        |
| Fn01B  | Vibration detection level initialization                                                      | 0                             | Digital Operator<br>Operating Manual                                  |
| Fn01E  | Display of SERVOPACK and servomotor ID                                                        | 0                             | (Manual No.: SIEP S800001 33)                                         |
| Fn01F  | Display of servomotor ID in feedback option module                                            | 0                             |                                                                       |
| Fn020  | Origin setting                                                                                | 0                             |                                                                       |
| Fn030  | Software reset                                                                                | 0                             |                                                                       |
| Fn080  | Polarity detection                                                                            | 0                             |                                                                       |
| Fn200  | Tuning-less levels setting                                                                    | 0                             |                                                                       |
| Fn201  | Advanced autotuning                                                                           | 0                             |                                                                       |
| Fn202  | Advanced autotuning by reference                                                              | 0                             |                                                                       |
| Fn203  | One-parameter tuning                                                                          | 0                             |                                                                       |
| Fn204  | Anti-resonance control adjustment function                                                    | 0                             |                                                                       |

## Program Table Edit/Save (FnB03)

This function edits and saves program tables. Saving a program table to flash memory after editing it ensures that the data will be retained even after the control power has been turned off.

## ■ Codes Displayed on the Program Table Editing Screen

Refer to the following section for information on interpreting the displays. *Reading the Screen* on page 17-9

| PGM<br>STEP | POS    | SPD    | RDST    | RSPD    | ACC    | DEC    | POUT    | EVENT  | LOOP    | NEXT    |
|-------------|--------|--------|---------|---------|--------|--------|---------|--------|---------|---------|
| 0           | POS000 | SPD000 | RDST000 | RSPD000 | ACC000 | DEC000 | POUT000 | EVT000 | LOOP000 | NEXT000 |
| 1           | POS001 | SPD001 | RDST001 | RSPD001 | ACC001 | DEC001 | POUT001 | EVT001 | LOOP001 | NEXT001 |
| :           | ÷      | ÷      | ÷       | ÷       | :      | ÷      | ÷       | :      | :       | ÷       |

## Preparation

The following conditions must be met to edit and save program tables.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- The program must not be running or on hold.
- A program table save operation must not be in progress for any means other than the digital operator.
- Execution of the RES command must not be in progress.

## ◆ Editing Program Table

The operating procedure when setting the acceleration (ACC) in program step 5 is explained here.

| Step | Display after Operation                                          | Keys | Operation                                                                                        |
|------|------------------------------------------------------------------|------|--------------------------------------------------------------------------------------------------|
| 1    | BB-FUNCTION-Fn207V-MonitorFnB03PGMEditFnB04ZONEEditFnB05JSPDEdit |      | Press the 😇 key to open the Utility Function<br>Mode main menu, and move the cursor with the<br> |

\* If setting is attempted in an operation prohibited state, it will not be possible to change the setting. In this case, make the setting again by referring to *◆ Preparation* on page 17-11.

## Method for Moving the Cursor

The values within the frames in the figure below are the articles and steps of the program table displayed at the digital operator.

\* You can move 4 rows at a time by holding down the 🔨 or 🔽 key. By using the 🕅 key at the same time as these keys, you can move 30 rows at a time.

## Details on How to Set Table Settings

Details on the setting method for step 5 in *Editing Program Table* on page 17-12 are shown below.

If the number of display digits is exceeded when Expansion Mode is enabled (PnB54 = 1), the table name will be abbreviated. Refer to the following section for details.  $\square$  12.4.6 Digital Operator Displays on page 12-12

Note: Refer to the following section for details on positioning types and target positions.

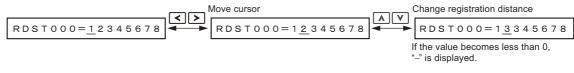

3.3.5 Settings in the Program Table on page 13-13

## SPD: Positioning Speed

Note: Refer to the following section for details on the positioning speed. *13.3.5 Settings in the Program Table* on page 13-13

## RDST: Registration Distance

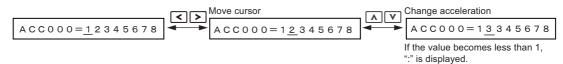

Note: Refer to the following section for details on the registration distance. 13.3.5 Settings in the Program Table on page 13-13

## RSPD: Registration Speed

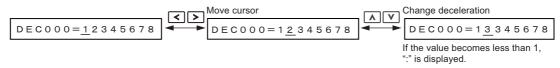

Note: Refer to the following section for details on the registration speed. *13.3.5 Settings in the Program Table* on page 13-13

#### ACC: Acceleration

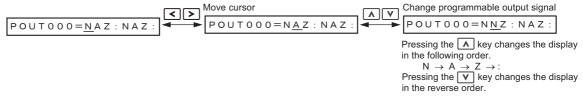

Note: Refer to the following section for details on the acceleration rate.

#### DEC: Deceleration

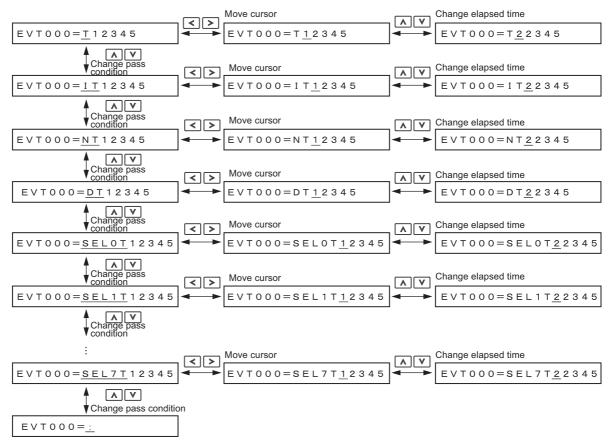

Note: Refer to the following section for details on the deceleration rate.

## ■ POUT: Programmable Output Signals

Note: Refer to the following section for details on the programmable output signals. 13.3.5 Settings in the Program Table on page 13-13

## ■ EVENT: Pass Condition

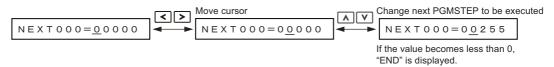

Note: Refer to the following section for details on the pass condition and elapsed time. *13.3.5 Settings in the Program Table* on page 13-13

#### ■ LOOP: Number of Executions

Note: Refer to the following section for details on the number of executions. 13.3.5 Settings in the Program Table on page 13-13

#### ■ NEXT: PGMSTEP to be Executed Next

Note: Refer to the following section for details on the program step to execute next.

13.3.5 Settings in the Program Table on page 13-13

## ◆ Saving Program Tables

The operating procedure for saving program tables is shown below.

| Step | Display after Operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Keys     | Operation                                                                                                                                                                                                       |

\* If the we is pressed in an operation prohibited state, "Error." is displayed for approximately 2 seconds and then the display returns to the program table editing screen. In this case, make the setting again by referring to *Preparation* on page 17-11.

### ZONE Table Edit/Save (FnB04)

This function edits and saves ZONE tables. Saving a ZONE table to flash memory after editing it ensures that the data will be retained even after the control power has been turned off.

#### Codes Displayed on the ZONE Table Editing Screen

For details on how to read the screen, refer to *Reading the Screen* on page 17-9.

| ZONE<br>Number | ZONE P | ZONE N |
|----------------|--------|--------|
| 0              | ZP000  | ZN000  |
| 1              | ZP001  | ZN001  |
| ÷              | :      | ÷      |
| 31             | ZP031  | ZN031  |

#### Preparation

The following conditions must be met to edit and save ZONE tables.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- A ZONE table save operation must not be in progress for any means other than the digital operator.

#### ◆ Editing ZONE Tables

The operating procedure when setting ZONE N in ZONE number 5 is explained here.

| Step | Display after Operation                                                                 | Keys | Operation                                                                                        |

\* If the key is pressed in an operation prohibited state, "Error." is displayed for approximately 2 seconds and then the display returns to the ZONE table editing screen. In this case, make the setting again by referring to  $\blacklozenge$  Preparation on page 17-17.

## JOG Speed Table Edit/Save (FnB05)

This function edits and saves JOG speed tables. Saving a JOG speed table to flash memory after editing it ensures that the data will be retained even after the control power has been turned off.

Refer to the following section for information on interpreting the displays. *Reading the Screen* on page 17-9

#### Preparation

The following conditions must be met to save and edit JOG speed tables.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- A JOG speed table save operation must not be in progress for any means other than the digital operator.

### Editing JOG Speed Tables

The operating procedure when setting the value for JOG speed table number 5 is explained here.

| Step | Display after Operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Keys | Operation                                                                                                                                                                                                                                                                           |

\* If the we is pressed in an operation prohibited state, "Error." is displayed for approximately 2 seconds and then the display returns to the JOG speed table editing screen. In this case, make the setting again by referring to *Preparation* on page 17-19.

### Program Table Initialization (FnB06)

This function initializes the program tables and restores the settings on shipment from the factory.

#### Preparation

The following conditions must be met to initialize the program table.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- The program must not be running or on hold.
- A program table save operation must not be in progress for any means other than the digital operator.
- Execution of the RES command must not be in progress.

| Step | Display after Operation                                                                         | Keys     | Operation                                                                                                                                                                                                                                                                                                                                             |

\* If the way key is pressed in an operation prohibited state, "Error." is displayed for approximately 2 seconds and then the display returns to the FnB08 operation screen. In this case, make the setting again by referring to • *Preparation* on page 17-23.

## Absolute Encoder Origin Setting (FnB09)

This utility function replaces the current position with a specified position. Also updates PnB25 with the absolute position offset value to achieve the position specified by this utility function.

## **A** DANGER

- This function replaces the coordinates of the reference position and is therefore very dangerous. After executing this function, check that the new coordinates match the reference position before starting operation.
- If the settings for any of parameters Pn20E to Pn210, Pn205, or PnB20 to PnB25 have been changed, turn the control power supply off and back on to bring the settings into effect before executing operation.

Important • The absolute position offset value is saved in parameter PnB25, so do not rewrite this value.

#### Preparation

The following conditions must be met to perform the absolute encoder origin setting.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- Distribution of position references must not be in progress.
- The absolute position offset value must not be outside the range for PnB25.
- An absolute encoder must be connected and Pn002 must be set to n.  $\Box 0 \Box \Box$ .

#### Operating Procedure

| Step | Display after Operation                                                                  | Keys     | Operation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### **INDEXER** Parameter Setting Initialization (FnB0B)

This function restores the default settings and initializes the parameters of both the SERVO-PACK and the INDEXER Module.

- Always carry out initialization of the parameter settings in the servo OFF status. It cannot be done in the servo ON status.
- To bring the settings into effect, always turn the SERVOPACK power supply off and back on after this operation.
  - When you execute Fn005, only the SERVOPACK parameters are initialized. The INDEXER Module parameters are not initialized. To initialize the INDEXER Module parameters, execute FnB0B.

#### Preparation

The following conditions must be met to initialize INDEXER parameter settings.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- The servo OFF status must be established.
- Initializing the parameter settings must not be in progress for any tool.
- The RES command must not being executed.

#### Operating Procedure

| Step | Display after Operation                                                                          | Keys            | Operation                                                                                                                                                                                                                                                                                                                                |

\* If the we is pressed in an operation prohibited state, "Error." is displayed for approximately 2 seconds and then the display returns to the FnB0B operation screen. In this case, make the setting again by referring to • *Preparation* on page 17-28.

### INDEXER Alarm Reset (FnB0C)

This function resets alarms at both the SERVOPACK and INDEXER Module, and clears the alarm history at the INDEXER Module.

- INDEXER Module alarms are not reset by the "ALARM RESET" button of the digital operator. To reset INDEXER Module alarms, execute alarm resetting with FnB0C.
- Eliminate the causes of alarms before resetting them.

When you execute Fn006, only the SERVOPACK alarm history is cleared. The INDEXER Module alarm history is not cleared. To clear the INDEXER Module alarm history, execute alarm history clearance with FnB0C.

### Preparation

When Resetting Alarms

None

 $\bigcirc$ 

#### ■ When Clearing the Alarm History

The following conditions must be met to reset INDEXER alarms.

- The write-prohibited setting (Fn010) must not be set to write-protect parameters.
- The ALMTRCCLR command must not being executed.
- The RES command must not being executed.

### Operating Procedure

Information To clear the alarm history, execute the Reset INDEXER Alarm (FnB0C) utility function with *Mode* set to *ALM History* (clear alarm history). The alarm history is not cleared when you reset an alarm (Mode = ALM state) or when the control power supply to the SERVOPACK is turned OFF. Refer to the following section for the procedure.

# 17.3 Alphabetical List of Serial Commands

The following table lists the usable serial commands in alphabetical order.

| Serial Command     | Function                                          | Reference  |
|--------------------|---------------------------------------------------|------------|
| ABSPGRES           | Absolute Encoder Reset                            | page 14-30 |
| ACCnnnnnnn         | Acceleration Specification                        | page 14-15 |

# 17.4 Corresponding Parameter Numbers

The following table shows the corresponding parameters between the SGDV-OCA03A INDEXER Module and the INDEXER Module for SGDH SERVOPACKs (JUSP-NS600).

| Parameter Name                                                                                                                                             | SGDV-OCA03A<br>Parameter No.     | JUSP-NS600<br>Parameter No. |
